

Monologue on *ENGINEERING*

<i>You are going to give a talk about ENGINEERING.</i>	The text of the monologue	Vocabulary, Grammar Structures, Linking Words and Phrases
Step 1. Introduction 1. Start with a hook sentence that will attract the listener's attention (a quote, a proverb, etc.). 2. Lead your speech steadily to the main part of your talk. 3. The introduction may consist of 3-6 sentences.	Engineering has always been one of the main driving forces of human progress. To begin with , we live in a world where technology changes every part of our daily life. That is why speaking about engineering means speaking about the future of society itself. As a matter of fact , it is important to understand how engineers improve the world and why their contribution cannot be overestimated.	
Step 2. From Engines to Engineers 2.1. Speak about engineers' contribution to society focusing on types of engineering and what each type is concerned with. 2.2. Speak about one of the greatest engineering achievements. How has it improved people's lives?	Engineers play a vital role in every industry. For instance , mechanical engineering, civil engineering, electrical engineering, biomedical engineering and computer engineering are just some of the many fields that shape our world. For example, biomedical engineers help to develop new medicines and design new products such as artificial organs and medical devices. Civil engineers are responsible for bridges, roads and modern cities. Computer engineers create advanced technologies that keep us connected. In all these fields, engineers do research , find a solution to a problem and put ideas into practice . One of the greatest engineering achievements was the invention of the aircraft. It allowed humanity to explore new worlds , shorten distances and make international communication much faster.	
Step 3. Superstructures 3.1. Speak about the largest man-made structure you've heard of or been to. Specify its size and function. 3.2. Would you agree/disagree that spending money on building superstructures can be justified?	One of the largest man-made structures I have heard about is the Great Wall of China. It is thousands of kilometres long and in some places it is more than ten metres high . It was built to protect people and control the territory. Modern engineering also creates superstructures like hydro-electric dams that cover huge square kilometres and generate electricity . They provide a wide range of jobs and stimulate the country's economic growth . Some people argue that spending enormous sums on superstructures is like employing a steam engine to crack a nut , but I believe such projects can give the country a sense of pride and keep up to date with modern technologies . Moreover , if they implement state-of-the-art techniques , they can even solve climate change problems and deliver real benefits.	
Step 4. CREATIVE THINKING Introduce your own extra idea(s) on the topic that hasn't/haven't been mentioned before. Justify your choice.	Speaking about the future, I believe that engineering will move even further to the cutting edge of science. Engineers will have to assess the feasibility of projects connected with space exploration and new energy sources. For example , we might need to develop a mathematical model of how to use high-powered instruments in space or how to operate equipment on the Moon. Another creative idea is to find new uses for old products: recycling waste into construction materials or energy. To implement an engineering project of this	

	kind, engineers must have specialised knowledge and cooperate globally. Therefore , only in this way will humanity be able to solve the most difficult challenges of the 21st century.	
Step 5. Conclusion Summarise the ideas of steps 2,3,4,5.	To sum up , engineering is not only about machines and structures, it is about people who improve the way the world works. Engineers design new products, create advanced technologies, develop medicines and explore new worlds. They also build superstructures that provide jobs, stimulate the economy and give pride to nations. Finally , they use their creativity to solve global problems and to keep up with modern technologies. Engineering will always be a respected profession because it connects science, practice and progress.
